## My Goldmorr Story

Before I tell you my story, let me tell you a little about myself. It helps the story make more sense!

I have been a forensic industrial hygienist for more than 18 years. Although I am licensed in lead and asbestos, my first love has always been mold and indoor air quality.

In my work I first determine if there is a mold problem. If I find a mold problem, I design and write the abatement protocol to remove the mold. I often oversee the actual abatement work. Successful abatement is then confirmed by clearance testing. I also work as an expert witness.

And I have solved a lot of mold cases throughout the United States! I stopped counting after I did case number 1,000, which was several years ago.

In the spring of 2011 I had the privilege to meet Rob Goldsworthy and Sue Morrice, and to attend their training to become a Goldmorr Master Technician. I have to admit at the time I thought it sounded too good to be true!

Very soon after returning from my Goldmorr training I had the opportunity to use the process. It was a particularly difficult case. The abatement contractor followed the protocol I had written to the letter. And yet he failed clearance – three times. My protocol was based on the traditional asbestos abatement techniques I had used for years. And even though we used air scrubbers, negative air, and every other tool in our toolbox, we could not get rid of the mold.

Very frustrating (and embarrassing)!

So I decided to use the Goldmorr process. We applied GM 6000 to the surface discoloration on the wall framing and on the subflooring. Then we fogged the air with GM 2000.

The results were spectacular!

Not only did we pass clearance testing the first time, but the wall framing we treated looked so good I was accused of replacing the old framing with new lumber.

Since then I have used the Goldmorr process on many projects, and have been delighted with the results each time.

Does the Goldmorr process work?

Absolutely! In fact the results still amaze me. I now use the Goldmorr system exclusively. It is faster and less expensive than any other abatement method I have used. Not only are my clients delighted with the results, but I also have a very competitive advantage over other mold abatement contractors still using the old methods.

If you are considering adopting the Goldmorr process as your mold abatement system, I highly encourage you to do so. I know you, too, will be amazed at the results.

Jon Dacken  
Forensic Industrial Hygienist  
Duluth, Minnesota

P.S. I have not received any compensation for telling you my story. I just wanted to share my success, and encourage you to enjoy the same spectacular results I see with every project.
